DESCRIBE THE PRESENT AND ORIGINAL (II known) PHYSICAL APPEARANCE

Phoenix Bridge crosses Craig Creek which joins the James River just above Eagle Rock in Botetourt County. The iron superstructure rests on two ashlar granite piers although one of the piers has been filled in on the bank side to form an abutment. The bridge is a trapezoidal Whipple truss with rolled wrought-iron "Phoenix post" compression members (composed of four flanged segments riveted together) and round and rectangular tension rods with pinned joints. The use of wrought iron for all parts except the joint boxes is a mark of bridges built after 1880, while the use of rods and riveted joints is an archaic feature retained in many smaller bridges built in remote areas to facilitate their erection. The bridge retains its wooden roadway.

The terminal portals of the bridge display considerable decorative work. At the top at each end is a spandrel with a cast panel embellished with anthemions and garlands and bearing the legend "Built by Phoenix Bridge Co., Phoenixville, Pa. 1887". Crowning the posts on either side of these panels are small urnlike finials. Other spandrels, about three feet below the upper ones, are pierced with quatrefoils and trefoils. The bridge's rural setting is unusually scenic and unspoiled.

STATEMENT OF SIGNIFICANCE

Phoenix Bridge survives as a notable example of the prefabrication of bridges for rural America in the nineteenth century. The product of one of the most important prefabricated bridge manufacturers, the Phoenix Bridge Company of Phoenixville, Pennsylvania, the bridge is a pinned flexible structure incorporating a Whipple truss and the firm's Phoenix posts. Architecturally, the bridge is a relic of an era when much effort was spent in decorating the products of industrial America. Its structural elements are ornamented with fanciful decorative elements including anthemions, finials, quatrefoils and trefoils. The structure is given added interest by its location in an unusually scenic setting at Eagle Rock along Craig Creek in Botetourt County.

The change from timber to iron bridge construction began in 1840 with the erection of two iron bridges across the Erie Canal in New York State but was retarded somewhat by the collapse of an iron railroad bridge in 1850, prompting the hasty replacement of many proven iron spans with wooden ones. Iron gradually recovered its prestige, however, and was back in use by the War Between the States.

After the Civil War, improved iron-working technology combined with a greatly increased demand for new railroad and highway bridges to create a boom in bridge building. Many new companies were formed to avail themselves of the opportunity either to exploit a new form of truss invented by the companies' owners, or to market patented varieties of bridge building elements, using truss forms licensed from their inventors. One of the largest of such firms was the Phoenix Bridge Company which was licensed to use the famous Whipple truss conceived by Squire Whipple of Utica, New York. Whipple was the builder both of one of the two 1840 bridges across the Erie Canal as well as the railroad bridge which collapsed in 1850 and was the author of several books on the theory of bridge design. The Phoenix Company's distinctive product was the Phoenix post, a compression member composed of four flanged segments riveted together, which is used in the Botetourt bridge. Such posts, formed of rolled wrought iron, copied the forms of, but in the 1870s replaced, the cast members used earlier. Phoenix posts were one of the two most popular varieties of these new wrought members.

In the 1880s, the flexible pin-connected structure such as the one in Botetourt County was considered to be the standard American bridge-building form. It was objected to on the grounds of durability, and the more rigid (see continuation sheet #1)

8. SIGNIFICANCE

riveted plate form of construction was known and used for railroad and high-way bridges after 1861. However, the older pinned form with round and square rods continued to be employed because it was light, could easily be prefabricated at the factory and shipped to remote locations like Eagle Rock, and because it required less time, equipment and skilled labor to erect on the site.
